Key Macro allows a graphical device to be turned on and off. KEYMACRO is a low-level device driver that can be used to turn on/off a graphical device. KEYMACRO is a low-level device driver that can be used to turn on/off a graphical device. The KEYMACRO provides the status register information through an interrupt. A: If you want to create a keylogger application, maybe you can create a WinAPI function that intercepts key press event. If you just want to record the keyboard events, using the keyboard hooks will work fine. Q: PHP mysql_real_escape_string remove quotes from string before insert I am trying to insert a string into a mysql table using the following query: $query = "INSERT INTO $table ($parameters) VALUES ('$string')"; mysql_query($query) or die(mysql_error()); The $string is given from the html form. I have noticed that sometimes when you submit the form, the $string contains single quotes around the string (ie. '"test"' instead of "test"), so when it is sent to the table it is cut off and the query does not work. I have tried removing the quotes using the following: $query = "INSERT INTO $table ($parameters) VALUES (". mysql_real_escape_string($string). ")"; I have also tried to use mysqli and prepared statements with little luck. Does anyone have any idea on how to stop mysql_real_escape_string cutting off the single quotes around the string? A: Here is the solution I came up with. function filter_string($string) { $string = str_replace('"', '', $string); //remove single quotes return $string; } $sql = "INSERT INTO $table ($parameters) VALUES ('$string')"; mysql_query($sql) or die(mysql_error()); This will remove the single quotes in the string before it gets inserted into the database. Q: Regex: How to accept only strings that have a leading character with a defined value? The regex should only accept strings that have a leading character that is any number. So 1d6a3396d6
