However, I'm trying to validate against a string, not a literal string. Is there a way to tell the Regex engine to ignore the "123, 456, 678, 987" and match against the "123, 456, 678, 987" in the input string? A: You may use a capturing group followed with a positive lookahead to match 1+ digits at the start followed with a non-capturing group followed with a comma and 1+ digits and then just assert what is in between: `@'^(\d+)\s*,?\s*(\d+)\s*, a1d647c40b`

Iron-sulfur clusters in mitochondrial biogenesis. Mitochondria contain three distinct iron-sulfur (Fe/S) clusters: those composed of 2Fe/2S, 3Fe/4S, and 5Fe/5S iron atoms. Genetic studies of yeast mitochondria suggested that each of these clusters, except the 2Fe/2S cluster, is essential. Recently, mammalian mtDNA studies have indicated that, while the synthesis of the 3Fe/4S and 5Fe/5S clusters in mitochondria is not essential, the synthesis of the 2Fe/2S cluster is a necessity. The deletion of a cytosolic Fe/S biogenesis protein, frataxin, leads to mitochondrial dysfunction. Mutations in the iron-sulfur cluster binding protein 2 (ISCU2) cause mitochondrial dysfunctions in patients with Friedreich's ataxia, a neurodegenerative disorder.
