Contents History Autodesk has been developing AutoCAD since the early 1970s. When CAD started, computers were bulky, noisy, expensive, slow, and insecure. Graphics, on the other hand, were readily available, fast, and inexpensive, thus providing an opportunity to market CAD software. In 1972, Autodesk created its first CAD product, Graphics Computer System (GCS). GCS was an integrated CAD/graphics package which was primarily designed for use in desktop computers with built-in graphic display devices (like the IBM 370) and a mainframe computer (like the IBM AS/400) as the CAD processor. This was a radical departure from the mainframe CAD packages which were usually run on a separate graphics workstation, with a "mainframe operator" (MCO) working at a terminal connected to the mainframe. Autodesk soon acquired a number of small, independent CAD package vendors and integrated their products into AutoCAD. This caused a major upheaval in the company. Many Autodesk employees left to start their own companies and many smaller companies with independent CAD products were acquired by Autodesk to become part of Autodesk. Documentation AutoCAD supports only a subset of standard geometric primitive data types, however the relevant data types used in AutoCAD are listed here. Types and storage Raster Type: Raster is stored internally in AutoCAD as Bitmaps, a one-pixel at a time graphical representation of an image. Unit: Pixels Size: Width × Height × Depth (width and height are not necessarily powers of 2) Storage: Required to store the bitmap data. All data is contained in the 24-bit deep storage buffer. Vector Type: Vector is stored in a matrix. Each unit can be represented as an infinite list of co-ordinates. It is not true that vector must be stored in 2D, some products are actually stored in 3D, even 4D. Unit: None. Automatically measured to a 1/1000 of a unit. Size: 2(x,y) if a 2D line, 2(x,y,z) if a 3D line, 2(x,y,z,w) if a 4D line. (x,y,z,w are dimensions). Storage: Required to store the data. It can be calculated from the size. The storage method used is not actually specified by the standard. AutoCAD stores the data in three main parts, which can be calculated based on the size of a vector. Storage of the first and second vectors: Storage of the third vector: The first and second part of the storage is used to store some of the data. The length and direction of the vector is stored in the first and second parts of the storage. This means that the length and direction of the vector can be calculated from the first and second parts of the storage. The first and second parts of the storage are the sides of a parallelogram. The points forming the sides of the parallelogram are not stored because they are not relevant for the length or direction of the vector. Using a parallelogram means that a given vector of length n can be represented with a vector of length |n| on the first and second parts of the storage. The direction vector of the vector can be calculated by multiplying the first and second parts of the storage with the pointwise basis vector of the parallelogram. Each of the three parts of the storage can have its own data. The ca3bfb1094

So the search returns a value, then the box indicates that value. When there's no data, then the search box is empty. I found this answer, and it works. I just can't figure out how to add the border. I tried messing with the CSS, but I have no idea what I'm doing. Can someone help?
