When you create your image, Elements treats each channel or color as a separate layer. Layers allow you to position them or move them all at once, delete them, or modify the image to create a new image. You can change the colors, the size and the position of the layers and change the arrangement of the layers. This tutorial teaches how to find, save, load and rotate the images from a stack of photograph. 1. Set up Images – Open the folder with the images on your computer. Create a new document in the same folder. Import the images in Photoshop Elements. 2. Load images into Photoshop Elements – Drag and drop one or more images from the file browser into the first Photoshop Elements workspace. 3. Change Color Profiles – In the Project panel, select the topmost layer in the stack. Then, click on the color. 4. Create New Layer – On the layers panel, click on the Create Layer button. Name it "Color." 5. Move Image into Work Area – Click on the image thumbnail in the Layers panel. It will move to the upper right of the workspace. 6. Open Layer – Click on the image in the Layers panel. Drag the image into

the editor window. When the image is open in the editor, click on the color group tab. 7. Create New Color Profile – Click on the color group. Then, click on the Profile drop-down menu. Click on the white button on the black bar to add a color profile. If you don't see this, click on the Add a Profile to the selected Color Table button. 8. Casting director (film) The casting director is a creative director responsible for the casting and screen-selection of actors and other performers for a given film, television or theatre production. Casting directors' responsibilities vary depending on the medium in which the film, play or television show is produced. A common responsibility includes choosing an ensemble that represents the diversity of contemporary culture. This can be for cast sizes that will accommodate as many of the audience's ethnicities as possible, particularly in the United States, although it may also be for a cast that will appeal primarily to a defined audience rather than all audiences. A casting director in theatre often has an extraordinary range of responsibilities. In most situations, they not only direct the performances of the actors that will populate a production but they also choose the costumes, props, scenic elements and lighting to be used. Over the course of the production, they may oversee many aspects of the design, construction and decoration of the stage, including the casting of scenic designers and fabric artists. They also direct the selections and vision of the choreographer, director, lighting designer, sound designer and costume designer. Like theatrical directors, casting directors who specialize in film may receive a percentage of the film's budget as compensation for their work. However, most casting directors are not contractually obligated to a particular film or television show, and can work for any number of productions or projects in a given year. Back in July, we told you that Apple had acquired Chomp, a startup that makes a tiny, USB-connected e-ink display that is designed to be placed in key areas in an enterprise network and display useful information such as active users, CPU or traffic status, or any other information that you want to be prominently displayed on individual desktops. Apple's acquisition of Chomp, we now understand, is in order to acquire the Chomp team as they continue developing the new set of ultra-thin Retina displays that are destined for future Apple products, including the upcoming Retina MacBook. A source that we spoke to has confirmed to us that Chomp's work on the new displays began at the end of 2010 and they were one of a number of former Chomp employees that Apple has brought on board to work

Marital practices and lung cancer among women in five European countries: The EPIC-Heidelberg study. Alcohol, tobacco, and obesity are three environmental and lifestyle factors that have been linked to lung cancer, but it is unclear whether their associations with lung cancer differ by sexual partners and whether behavioral differences in intimate relationships might explain gender disparities in risk. In the present study, we examined these questions in a prospective cohort study of 182,851 women from five European countries (Denmark, France, Germany, the Netherlands, and Sweden). Life course patterns of tobacco, alcohol, and body mass index (BMI) were investigated with respect to marital practices and lung cancer risk, using Cox proportional hazards regression. After adjusting for potential confounders, lifetime abstainers from alcohol who did not want to have children (referent: ≥ 1 partner) had a significantly increased risk of lung cancer (RR = 1.35, 95% CI: 1.10-1.65) compared with those in a stable partnership with ≥ 1 partner. Compared with lifetime abstainers from alcohol and those who wanted to have children, increasing lifetime abstainers from alcohol had significantly increased risk of lung cancer. For smoking cessation, the risk of lung cancer was significantly increased among lifetime abstainers who did not want to have children in all three countries, but not in Denmark and Sweden. For obesity, there was no increase in risk for any marital status. We found no evidence that the association between life course patterns of alcohol and lung cancer differed by sexual partners. Our results suggest a biological explanation for the excess lung cancer among women in stable partnerships and among women who have quitted or failed to quit alcohol use. The invention is particularly suited to the processing of a viscous product, but the invention is also suited to a product which is in the form of a liquid. The product to be processed is a product which is solated. In other words, it is a product in which one or several compounds have been dissolved. Depending on the case, the compound may be a compound of a metal and/or a metal alloy, of a resin, a polymer, a mineral, a polysaccharide, or a compound of another organic substance, of an inorganic substance or of a mixture of organic and inorganic substances. The product thus treated may also have been subjected to previous treatment, so that it has been impregnated or coated. This type of product is used in many fields of industry, such as the preparation of textiles, the
