ProActivate! Version: 1.0.0.15024 Install Date: 2012-08-21 Size: 185.81 K Program (s) ExeShield Pro is a lightweight utility for searching/locking EXE and DLL files on hard drive. It keeps using disk space for the moment it is not closed, so it can be used for safe storage/protection of useful data. You don't need to be aware of the technical details of EXE files to use ProActivate! because this utility does all the real work for you, including: *browsing or searching through all the files in the specified folder/drive *locking the files with read-only attribute *setting the time expiration after which files are deleted *setting the permissions, thus allowing you to restrict access to the files *adding the specified files/folders to the exclusion list. The limitation of this utility is that it only works with the standard disk formatting. It does not support the advanced partitioning. When you try to lock a file without format, a message about the file format is displayed, and the operation is discontinued. This is why we recommend that you save all the files that you want to keep in the C:/ drive. You can also specify that particular files be automatically saved in the specified folder of the hard drive. One interesting feature is the possibility to display the thumbnail of the given file. The access to a locked file can be performed only if the drive letter of the target directory is set. This is why we recommend that you use the C: drive as a working directory. This feature does not use the hard disk space, and all the activity connected with its presence is minimized. You have not accepted the legal terms and conditions for this item. ===== ExeShield Deluxe is a security tool that protects executable files (EXE format) against crackers and hackers. The interface of the program is made from a small window with an uncomplicated layout. Opening a file can be done by using only the file browser, since the "drag and drop" functionality is not supported. Unfortunately, you cannot secure multiple items at the same time. So, you can find out the Cyclic-Redundancy Check of a file (CRC32), specify the compression method (Pepack 1.0, Polyene 0.01, UPX 1.25, UPX 2.02) and proceed with the encryption procedure. Plus, you can save the file to the ExeShield format (CPL) for further modifications. By switching to ExeShield Cryptor mode, you have access to additional options regarding the encryption mode, such as the anti-cracker software (anti dumping), beta security (clear PE header, debugger detection) and general security parameters (API redirect, clear import information, CRC check). ExeShield Deluxe runs on a very low amount of CPU and system memory, so it does not interfere with the runtime of other active processes. It has a good response time, offers multilingual support and worked smoothly during our tests, without hanging, crashing or popping up error dialogs. Unfortunately, no recent updates have been made to the tool. Although its features are easy to set up, ExeShield Deluxe primarily addresses power users.
