A: If an eMMC drive is formatted, it loses its partition table. To fix that, just reformat. In the past, there were experiments with signing that code (by adding the signature to the disk information). But I believe those signatures now can cause more problems than they solve (due to improper formatting). Problems that have been reported with that: Disk Space - Disk image was 200MB, after signing had been applied; only 195MB were visible. Firmware updates - Every time the firmware updates were signed, the disk image was found to be corrupted. Firmware updates - Every time the firmware updates were signed, the disk image was found to be corrupted. Firmware updates - Every time the firmware updates were signed, the disk image was found to be corrupted. When signing and formatting the OS, check the industry standard - "system partition" naming. It is a good idea to use an OEM image rather than one from the OS developer. // Copyright (c) Microsoft Corporation. All rights reserved. // Licensed under the MIT License. Gnoemk I have a HP Slimline tm5vxxxx00. No matter what i try, i can't see it on usb devices. It could be some setting like "noauto" to automatic or "devlist" to read only device. In which... Toshiba Qosmio F20-A1I0AU Notebook I have a toshiba satellite c855, installed windows 7 ultimate 64 bit, the problem i have is that my headphones are not recognized, but sometimes it works. A: It is probably not a power problem. I think it may be an issue where the volume is not turned up enough. Many mobile devices, such as laptops have volume buttons, so perhaps the one on this notebook is not working. You would need to find out what the status of the volume control button is and possibly see if you can adjust it. Q: How do I make a field take the max value of a join column How can I create a query to make the column "Number" take the maximum value of number of records in the table? I have these tables user - userid (pk), username id - userid, id (pk) user_address - userid, street, city, state, number, zip user_address_id - id, userid, addressid (fk) id - userid, id (pk) id The result of the query should be userid - street How do I do this? A: There are two joins required. The first looks for the maximum number per user and the second joins back the user to the original row. SELECT user.userid, MAX(user.street) AS max_street FROM user INNER JOIN user_address_id ON user.userid = user_address_id.userid INNER JOIN user_address ON user_address_id.addressid = user_address.id WHERE user.userid = 123456 GROUP BY user.userid In MySQL 8+, you could use windowed functions: SELECT user.userid, street.max_street FROM user INNER JOIN user_address_id

You have to visit the link and copy/paste the code. Or do like I did, and create a Telegram bot using an online tool and put the Telegram link in it. You can then use the bot to get results like this one: Q: nested scrolling in android gridview im trying to implement a nested scrolling feature in my gridview, but somehow the vertical direction isn't working. The current implementation just scrolls the gridview vertically. This is what the problem looks like. The problem is that i want to scroll horizontally. Source: A: The way you define your grid
