Automation API The Automation API allows an application to manipulate aspects of a drawing. There are two kinds of automation: automated actions (similar to macros) and automated tasks (similar to workflows). Automated actions are designed to work in the user interface (UI) and can affect multiple objects. Automated tasks are designed to work in the

---

drawing, and can affect individual objects. Open the Application Menu. Click Edit > Automation > Automate. To perform an automation, the application must have access to the drawing, the document context, the active cursor, and the automation settings.

For more information, see the article "How to use the automation APIs". Visual LISP API Visual LISP allows developers to build their own solutions for interaction between AutoCAD and their own programs. Its user interface is called MacroHook. To open the Visual LISP editor: Open the Application Menu. Click Edit > Macros > MacroHook. To create a

---

new Visual LISP macro: Click the New icon. In the File name box, type the name of the macro. Press Enter. In the Code box, paste the code you want to execute. In the Add an argument box, type the argument you want to pass to the macro. Click the small button to the left of Add an argument. In the Tool tip box, type a short description of the macro. To perform a macro: Open the Application Menu. Click Macros > MacroHook. Click the menu item to which you want to assign the macro. If the macro does not appear in the menu, refresh the menu. The Visual LISP editor has a number of predefined macro

---

types, such as types for: Aligning views, or for creating temporary views. Changing the viewing direction. Defining toolbars. Modifying parameter settings. Creating objects. Theming the workspace. Macros are not saved permanently, but they can be saved between sessions using the Save button at the top of the editor. After the first save, there is a limit of two macros per session. Some examples of Visual LISP macro types: Viewing direction, in order from top down: You can view the drawing in right-to-left direction. You can view the drawing in right-to-left and top-to

Source: A: The present invention relates to a method and apparatus for measuring a clearance between a rotor and a stator in a rotary electric machine. FIG. 4 is a sectional view of a rotary electric machine which includes a rotor 1 and a stator 2. In the rotary electric machine, a shaft 3, whose inner peripheral surface is

---

cylindrical, is disposed on the rotor 1 and in the stator 2. The shaft 3 is inserted through a hole 4 formed in the rotor 1 and the stator 2 and is fixed to the rotor 1 and the stator 2 by welding. A clearance  $c$  between the rotor 1 and the stator 2 is set to the tolerance between the outer diameter of the shaft 3 and the inner diameter of the hole 4. To measure the clearance  $c$  accurately, it is necessary to accurately measure the outer diameter of the shaft 3. A conventional method for measuring the outer diameter of the shaft 3 is as follows. A rotation angle of the shaft 3 with respect to a reference position is measured by a rotation angle sensor, which is

---

not illustrated. An angle is detected in a stop position of the shaft 3, and an edge of the shaft 3 is recognized from a magnetic flux which is induced in the shaft 3 by using a magnetic flux detection sensor, which is not illustrated. In this manner, a stop position of the shaft 3 is recognized. The outer diameter of the shaft 3 is detected based on the detected angle. A conventional method for measuring the clearance  $c$  will be explained. The outer diameter of the shaft 3 and the stop position of the shaft 3 are firstly measured. A magnetic flux detection sensor, which is

AutoCAD with the ability to import and export multipage drawings. Extensive search and filtering capabilities. Ability to view diagrams within designs. Ability to seamlessly transfer the design intent from one page to the next. Drawing template: Export design from one page to the next with a visual representation of how the design should be coordinated. Design templates allow you to easily repeat a design or adjust the design to make it fit. Incorporate data from the Internet. Import the design of a drawing from an existing CAD model with an integrated search and filter capability. Drag and Drop:

---

Integrated with the Web browser, Drag and Drop enables you to: Create a project based on an external URL. Import a shared presentation or existing drawing from the Web. Add a URL to the local file system with a quick mouse click. Mobile: With built-in touch screen support, AutoCAD Mobile enables you to edit 2D drawings without a mouse and keyboard. Available for both iOS and Android operating systems, it allows you to work with AutoCAD in a natural, touch-based environment. Make it easy to draw on the mobile device, because it supports the drawing gestures you use in the software. You can draw

---

shapes, easily select them and then use them to move and edit paths.

**Automatic Dimensioning:**

AutoCAD automatically dimension 2D drawings for you. An in-line dimension dialog box is displayed that you can quickly move to the desired dimension. A corner, midpoint or perpendicular dimension can be selected and measured in millimeters, points, inches or any other common dimension type. With this feature, you can easily create, modify or join the dimensions in a drawing.

**Gantt Chart:** With the ability to create project schedules or Gantt charts, you can plan, organize, and visualize your work more

---

effectively. **Simultaneous Editing:** With simultaneous editing, you can open multiple editors in a drawing at the same time. Each editor is a completely separate unit of work, allowing you to work on two or more separate parts of a drawing at the same time. You can quickly switch between editors and continue working on the parts of the drawing. You can also open an editor in full-screen mode for additional productivity. **Plan and track projects:** Create schedules and
