Features AutoCAD (top) and Microstation (bottom) are two of the most popular CAD applications on the market. AutoCAD has three main components: 2D drafting, 3D modeling, and 2D and 3D animation. AutoCAD is primarily used for drafting and creating technical drawings, with 3D modeling and animation applications, such as AutoCAD Architecture, AutoCAD Electrical, and AutoCAD Mechanical, growing in popularity. AutoCAD is also used for CAD-related design and simulation, such as creating tools, text, and graphs. 2D Drafting AutoCAD is an excellent drafting software application, and many users have called AutoCAD "the best drafting package ever made." As a CAD system, AutoCAD can be used to create technical drawings, such as architectural and mechanical drawings. In 2D drafting, the user creates a drawing on the computer screen, manually or automatically, and adds objects and lines to the drawing. These objects are referred to as layers. Objects and lines can be placed on one or multiple layers. Some layers, such as the background, are usually included in every drawing. The layers are shown in order of depth. To place objects on a layer, the user clicks on a layer in the Layers palette and then clicks on an object. The object is placed on the layer at the click location. For complex layers, the user can draw or click on the layer's outline to place the object. The user can define the orientation of objects. As a result, complex structures can be created without the use of any special objects, such as a box, a plane, or a drawing axis. The user can create many of the most commonly used drawing functions, such as creating a circle, polyline, polygon, or arc. In addition, the user can generate many geometric objects such as ellipse, line, polyline, spline, and ellipse. Geometric functions are called "geometric," or "geometric operations," because they are geometric commands rather than "tricks." Applications The following is a list of applications made available as add-ons for AutoCAD: Applications are listed alphabetically. AutoCAD Architecture AutoCAD Architecture is a commercial application developed by Autodesk for architectural design and engineering applications. Architectural design, as with any architectural and engineering disciplines, includes a complex series of steps from analysis to design to documentation. In practice, an architectural design project involves designing, researching, designing, and documenting. Autodesk Architecture fills the gap in the design process by providing the services for documenting, tracking and communicating architecture design progress in a way that is unique to architecture. AutoCAD Architecture uses the ADR Model, a unique form-based interactive process, to achieve an architecture design that is both accurate and intuitive. The ADR Model is inspired by and imitates the way architects create a building through a series of design steps. It guides the designer through a series of process-driven steps, each of which is recorded as a building block and linked together to create the final architectural design. As the design evolves and progresses, so does the documentation. The new visual elements, such as new design parts, revisions of existing design parts, and even major new layouts, are linked to the original drawing and documentation. AutoCAD Architecture is an integrated, web-based, collaborative design and documentation solution for architectural design, planning and management.

Architectural design includes activities such as schedule and cost management, professional collaboration, project planning, and project management. AutoCAD Architecture uses an open, dynamic platform to help you work collaboratively with a team of architects and consultants to accomplish multiple design and documentation tasks. It is integrated with other Autodesk applications, including Autodesk Revit Architecture. It is also designed to accommodate the needs of both large and small businesses. If the product is purchased from AutoDesk at a discounted rate, it can be activated from January 30, 2016 until May 30, 2017. AutoCAD Architecture on Microsoft Windows and macOS AutoCAD Architecture is a web-based solution for architecture design and documentation. It can be used with either Windows or Macintosh computers, and can be accessed at the AutoCAD.com web site or by using the Autodesk Inventor Application Accelerator for Windows or Autodesk Inventor Application Accelerator for macOS software. In this case, the software communicates with the Autodesk product through a web browser interface.

Q: Check if a key is present in a dictionary of pairs If I have a dictionary of pairs, such as: `val_pairs = { (1, 'a', 0.123), (1, 'b', 0.1235), (2, 'c', 0.12345), (2, 'd', 0.1234), (2, 'e', 0.12), (3, 'f', 0.123456789), (3, 'g', 0.12345) }` how can I test whether a key is present in the dictionary? I tried using this code, but the test always returns True, which it shouldn't: `dict_of_pairs = { (1, 'a', 0.123):'b', (1, 'b', 0.1235):'c', (2, 'c', 0.12345):'d', (2, 'd', 0.1234):'e', (2, 'e', 0.12):'f', (3, 'f', 0.123456789):'g', (3, 'g', 0.12345):'h', }` `def key_test(key, dict_of_pairs): for k, v in dict_of_pairs.items(): if k == key: return True else: return False print key_test(1`
