the evidence of this was that some high-profile attacks happened between 09:37 and 10:16. the bagle worm was likely spawned at 09:37 as the largest number of ip addresses indicated by the worm's c&c servers were connected at this time. the worm then infected 25 servers a half hour later, and at this point the worm had 1,000,000 active infection engines by the time the bagle worm detections stopped at 10:16. malicious software that started at around 09:37 p.m. gmt and continued until 10:16 p. gmt was able to attack the targets because the worm contained two built-in timers: a 5-second ping timer and a 10-minute delay timer. when these timer values were exceeded, the worm would start its c&c protocol. then, when the 10-minute delay timer expired, the worm generated a new ip address and began sending bagle-like data packets to the first 25 ip addresses that it contacted, using the ip address of one of the bagle-infected machines. the pattern of bursts in the final stage of bagle's propagation immediately made it obvious that the attack was designed to strike until the worm's resources were exhausted. when the worm used five or more of its c&c servers as targets and expired both its ping and delay timers, the worm's c&c servers would wait a short while before replying, during which time any more ip addresses that the worm contacted would be infected. the first phase of bagle was to use the bagle executable (bagle.exe) on the infected machine to find and infect vulnerable computers on the same subnet. the worm did not check to make sure that a requested hostname was valid, and therefore the worm often tried to infect any machine that had the name of a valid hostname with the "hostname" command. in addition, the worm also did not check whether a hostname was locked down or not, and therefore it tried to use netbt to connect to many valid hostnames on the same network. in this phase, the worm would scan for.exe and.com files, and attempt to download one of those as the worm's main payload. if the file did not exist, the worm then attempted to download from its c&c server and attempt to execute the file. 5ec8ef588b
