The KEYMACRO is a small circuit that performs a MACRO for an I/O pin. Each MACRO is composed by a MACRO program and a transmission mode. You can choose which MACRO to use for your project. For example, you can write a program to output the active level of a pin using the following command: MACRO: PROG="D:\PICs\PROG_MACRO\PROG_MACRO.CPP" MODE: OUTPUT = "D:\PICs\LED\IO" You can also use the VECTOR mode (command: VECTOR OUTPUT) and send data as a string. The program is structured in a set of programs which perform MACROs on the I/O pin. MACRO programs: COMM: COMMAND LINE MACRO MACRO: MACRO PROGRAM NAME MODE: OUTPUT, INPUT, SERIAL, VECTOR,... Transmission mode: CMD: COMMANDS FOR GENERATING I/O PINS INPUTS FILE: DATA FOR GENERATING I/O PINS INPUTS TRANSFER: FILE TRANSFER This function can work as a serial communication that processes commands, reads them, and outputs them into a file. CHARACTERISTICS: MACRO: 1 to 8 lines for programs and 1 line for commands. Commands: 1 line for commands, 2 lines for input data. File format: 1 line for commands, 2 lines for input data, 3 lines for output data. Important Notes: If the transmission mode is not specified, the program assumes the COMMAND mode. If the transmission mode is VECTOR, the program assumes the FILE mode. If a transmission mode is not specified, the program assumes the COMMAND mode. If an I/O pin is specified in the program, the program will send out the data on the I/O pin. The data will not be stored in the program. The I/O pin used is specified in the PROGRAM. The program starts once the COMMAND is entered. If the program is connected to the specified I/O pin, the program is not started. If the program is connected to the specified I/O pin, the program will not be started. Programs: CMSIS: CDC Microcontroller Software Interface USE: 2edc1e01e8
