Parenteral delivery of bioactive agents, particularly proteins and peptides, is of considerable interest. Frequently, these agents cannot be administered orally due to degradation by proteolytic enzymes in the gastrointestinal tract or because of poor absorption from the gastrointestinal tract. Delivering proteins and peptides to the intestinal mucosa, and other tissues in the body, is a particularly challenging problem. Typical peptide and protein drugs are very susceptible to rapid proteolytic degradation. This property is especially undesirable for drugs that are intended to be delivered to a patient over an extended period of time. To protect drugs delivered by a parenteral route, the drug can be microencapsulated. Microcapsules are small spheres which have two distinct and separate phases, a core containing a drug or vaccine formulation and a wall (or shell) that surrounds the core containing one or more protective agents. Typical microcapsule shell materials include proteins, polysaccharides and lipids. Liposomes are microscopic vesicles formed from amphipathic lipids arranged as closed bilayers surrounding aqueous solutions. Liposomes can be prepared using a number of procedures, including spray drying, sol-gel, reverse phase evaporation, and electric field techniques. Although microcapsules and liposomes can provide protection from the adverse effects of proteolytic enzymes and can extend the half-life of encapsulated proteins and peptides, an issue of particular importance is the rate at which the microcapsules and liposomes release their contents in the body. This is especially important for drugs which are intended to be released to the body over an extended period of time, for example, for more than about one month or up to one year. The rate of release of drug from a microcapsule or liposome can be controlled by manipulating several parameters. For example, a microcapsule or liposome can have a polymeric coating (U.S. Pat. No. 4,137,176; U.S. Pat. No. 4,265,925; U.S. Pat. No. 4,540,587), a semipermeable membrane (U.S. Pat. No. 4,702,716), a hydrophobic phase change material (U.S. Pat. No. 5,766,633), a biodegradable polymer (U.S. Pat. No. 4,957,711), or a combination of such materials. Microcapsules with a drug
