Cracking software is illegal. We cannot condone or encourage you to crack software, even though there are several valid reasons for doing so. The most common reason is getting a crack for the software. With a crack, you can get the software for free. However, cracking software puts the software vendor at risk of getting sued. If you crack software, you break the terms of use and you risk getting sued. Even though the software is free, it is still illegal. Cracking software is also against the terms of use of the software itself. So, make sure that the version of software that you are downloading is not cracked or you could be breaking the terms of use of the software that you are using.

I would have been perfectly happy to end this review at this point, but unfortunately the last question brings us on to the downsides of Adobe's rightly popular image management and RAW converter tool. I did say Lightroom emphasizes speed, but perhaps clarifying this statement is in order. The emphasis on speed lies in the flexibility of available tools. For example, you can now do some advanced image "healing" with the updated Spot Removal tool and remove objects that are more complex than simple dots. And that saves you time working with Photoshop on the same image, which I personally appreciate very much. When it comes to the actual speed of operation, however, things haven't really changed for the better. Importing is, if anything, slightly slower. The same with Exporting, which also feels to be more sluggish than before. Use that brilliant Spot Removal tool too many times on too many photographs and you may experience lag when changing adjustments or moving from one image to another. Other obvious bugs and performance issues do not make a very good impression, either. Of course, complex Spot Removal shapes are bound to eat up those resources. After all, there is quite a bit of vectoring involved, not to mention that the image is not actually changed since Lightroom applies changes non-destructively. In essence, any adjustments you perform, including the Spot Removal and the Radial Filter tools, remain as descriptions that must be read by the software. Even so, I believe that a careful optimization of how computer resources are used, as well as some database tweaking should be possible. Or perhaps Adobe needs to start utilizing some in-memory database processing features that we see in enterprise-class databases and applications today. Yes, the speed of modern computers is faster than ever, but with the software getting more and more complex, I feel that Adobe should invest some time in optimizing and tweaking it. It took Adobe a while to add full 64-bit support to Lightroom and I am not sure how well it actually utilizes multi-core CPUs and caching technologies. Probably not enough, considering how slow Lightroom can get.

Working with photos and other media, software can be an efficient and enjoyable part of the creative process. However, not all software is created equally, and Photoshop is known worldwide for its extensive set of tools and capabilities. When it comes to computer performance and running multiple applications at the same time, nothing beats dedicated, high-performance computers. Together, these two components make Photoshop brilliant at working with all types of media like photos, video and more. Adding 4GB of RAM to the processor is a perfect first step towards Photoshop being more sustainable for the future.
