When creating a photo and selecting the right image extraction method, it's important to choose the RAW to TIFF conversion method. The default method is straight RAW to TIFF, which generates a TIFF file in the format of the original image data, including information about the color space. Unfortunately, this process normally overwrites the original EXIF data. This leads to an image that doesn't even look like the original RAW file anymore. Photoshop Elements offers two options:

- RAW to TIFF, which preserves the EXIF data, but the colors are clipped and will lose some data. So if you want to print the image, you need to convert it to a new TIFF file using Photoshop after you've finished.
- Thanks to Adobe, you can now convert images to PDFs , and then you can extract the Photos from the PDF file window in Elements (see the bottom of this review to learn how to do it) and save it as TIFF.
